## Data Visualization Using R & ggplot2

Naupaka Zimmerman (@naupakaz) and Andrew Tredennick (@ATredennick) (and Karthik Ram (@\_inundata))

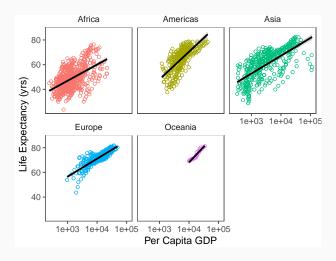

August 5, 2018

## Some housekeeping

#### Install some packages

```
install.packages("ggplot2", dependencies = TRUE)
install.packages("ggthemes")
install.packages("tidyr")
install.packages("dplyr")
```

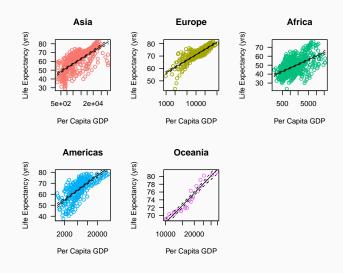

#### 1 minute

#### 1 minute

```
library(ggplot2)
library(gapminder)
library(ggthemes)
ggplot(gapminder, aes(x = gdpPercap, y = lifeExp)) +
  geom_point(shape = 1, aes(color = continent)) +
  stat smooth(method = "lm", size = 1, color = "black") +
  scale_x_log10() +
  xlab("Per Capita GDP") +
 ylab("Life Expectancy (yrs)") +
  facet_wrap(~continent) +
 theme few() +
  guides(color = FALSE)
```

#### 30 minutes

#### 30 minutes

```
library(scales)
library(gapminder)
gapminder <- as.data.frame(gapminder)</pre>
conts <- unique(gapminder[,"continent"])</pre>
cols <- scales::hue pal()(length(conts))</pre>
par(mfrow = c(2,3))
counter <- 1
for (i in conts) {
  plot(gapminder[which(gapminder$continent == i), "gdpPercap"],
       gapminder[which(gapminder$continent == i), "lifeExp"], col = col
       xlab = "Per Capita GDP", ylab = "Life Expectancy (yrs)",
       main = i, las = 1, log = "x")
  fit <- lm(gapminder[which(gapminder$continent == i), "lifeExp"] ~</pre>
```

#### But wait, there's more...

```
log(gapminder[which(gapminder$continent == i), "gdpPercap"]))
pred <- predict(fit, interval = "confidence")
lines(sort(gapminder[which(gapminder$continent == i), "gdpPercap"]),
lines(sort(gapminder[which(gapminder$continent == i), "gdpPercap"]),
lines(sort(gapminder[which(gapminder$continent == i), "gdpPercap"]),
counter <- counter + 1
}</pre>
```

- More elegant and compact code than with base graphics
- More aesthetically pleasing defaults than lattice
- Very powerful for exploratory data analysis

- gg is for grammar of graphics (term by Lee Wilkinson)
- A set of terms that defines the basic components of a plot
- Used to produce figures using coherant, consistant syntax

- Supports a continuum of expertise
- Easy to get started, plenty of power for complex figures

## The Grammar

### Some terminology

#### Data

- Must be a data frame (data.frame(), as.data.frame())
- Gets pulled into the ggplot() object

#### tidyr

Helps your data play nice with ggplot

## **Aesthetics**

### Some terminology

#### aesthetics

- How your data are represented visually
  - a.k.a. mapping
- which data on the x
- which data on the y
- but also: color, SIZE, shape, transparency

## **Geometries**

## Some terminology

#### geometry

- The geometric objects in the plot
- points, lines, polygons, etc.
- functions: geom\_point(), geom\_bar(), geom\_line()

#### **Basic structure**

```
ggplot(data = iris, aes(x = Sepal.Length, y = Sepal.Width)) +
    geom_point()

# Equivalently...

myplot <- ggplot(data = iris, aes(x = Sepal.Length, y = Sepal.Width))
myplot + geom_point()</pre>
```

- Specify the data and variables inside the ggplot() function.
- Anything else that goes in here becomes a global setting.
- Then add layers: geometric objects, statistical models, and facets.

### Don't be tempted!

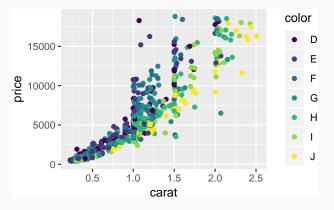

- NEVER use qplot() short for quick plot.
- You'll end up unlearning and relearning a good bit.

## Exercise 1

#### Exercise 1

```
# Make a small sample of the diamonds dataset
d2 <- diamonds[sample(x = 1:nrow(diamonds), size = 1000), ]</pre>
```

#### The make this plot:

## **Stats**

#### Some terminology

#### stats

- Statistical transformations and data summary
- All geoms have associated default stats, and vice versa
- e.g. binning (the stat) for a histogram or fitting a linear model

## **Facets**

## Some terminology

#### facets

- Subsetting data to make lattice plots
- Really powerful
- I use in almost every publication

## **Scales**

### Some terminology

#### scales

- Control the *mapping* from data to aesthetics
- Often used for adjusting color mapping (i.e., setting colors manually)

#### Refer to a color chart for beautiful visualizations

http://tools.medialab.sciences-po.fr/iwanthue/

#### Some common scales

```
scale_fill_discrete(); scale_colour_discrete()
scale_fill_hue(); scale_color_hue()
scale_fill_manual(); scale_color_manual()
scale_fill_brewer(); scale_color_brewer()
scale_linetype(); scale_shape_manual()
```

## **Coordinates**

### Some terminology

#### coordinates

- Not going to cover this in detail
- e.g. polar coordinate plots

#### Don't try this at home...please!

```
ggplot(mydata, aes(x = "", y = proportion, fill = group)) +
  geom_bar(stat = "identity", width = 1) +
  coord_polar("y", start=0) +
  theme_void()
```

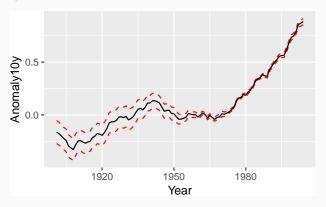

Putting it all together with more examples

# Histograms

# Line plots

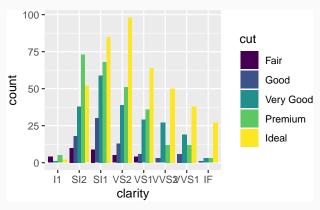

• Modify the last plot and change the ribbon to three separate lines, like below:

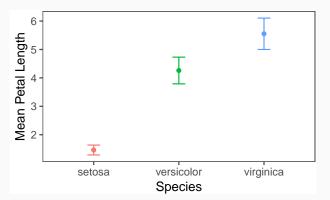

# **Bar plots**

# Exercises 3, 4, & 5

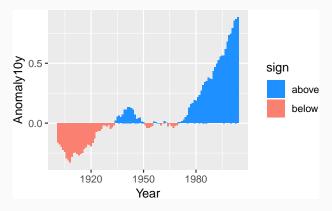

Using the d2 dataset you created earlier, make this plot:

Use dplyr to summarize the iris data, then make the plot below.

- Using the climate dataset, create a new variable called sign.
   Make it categorical (above/below) based on the sign of Anomaly10y.
- Plot a bar plot and use sign variable as the fill.

## **Density plots**

# **Adding smoothers**

## Themes!

### **Adding themes**

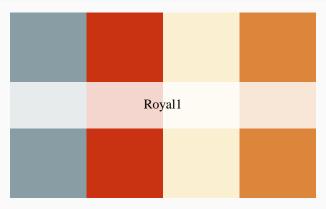

- Everything can be customized using theme() settings
- http://ggplot2.tidyverse.org/reference/theme.html

### What about Wes Anderson?

### There's a theme for that!

```
# install.packages('wesanderson')
library("wesanderson")
# display a palette
wes_palette("Royal1")
```

# Save your beautiful plot

If the plot is on the screen

```
ggsave('~/path/to/figure/filename.png')
```

• If your plot is assigned to a named object

```
ggsave(plot1, '~/path/to/figure/filename.png')
```

Specify size

```
ggsave(file = '~/path/filename.png', width = 4, height = 3, units = "in
```

And format

```
ggsave(file = "/path/to/figure/filename.eps")
ggsave(file = "/path/to/figure/filename.jpg")
ggsave(file = "/path/to/figure/filename.pdf")
```

### Further help

- We've only scratched the surface
- Practice
- Read: http://ggplot2.tidyverse.org/index.html
- Work together
